

Hyperlocal Platform: Business Idea and Advertisement Strategy

Business Definition and Scope

A clearer definition:

"A **hyperlocal platform** where people **help, trade, and hold things for each other**, powered by trust."

That includes:

- Buy/sell items (Karrot-style)
- Borrow/lend
- Small gigs (pickup, errands)
- Package holding (your original SafeDrop idea)
- Gather people for the Uber ride to IKEA or COSTCO
- Group Hangout

"돈이 오갈 수 있는 Reddit"

- Idea: rechargeable cash in this platform, quick and easy transfer (i.e.—Venmo system)

Main Advertisement Strategy

The main advertisement strategy focuses on **Student micro-help(business)**, not the marketplace.

Segment A: Students who need general help

Advertise to:

- Freshmen

- International students
- Students without cars
- Students living off-campus
- Students in dorms/apartments
- Busy students with classes/jobs

Message:

"Need something done nearby? Ask a verified student."

Segment B: Students who want side gigs for money

Advertise to:

- Students who stay near campus
 - Students with flexible schedules
 - Students looking for quick small money
 - Club members / student workers / RAs / commuters
- self advertise through their personalized link
 - this would also promote this platform automatically

Message:

"Make quick money helping students nearby."
(They will be able to generate URL link to advertise them)"

Example template

Section	Target Audience	Key Message	Notes
Side A: Need Help	👤 Person	👤 Person	List specific student groups to target.
Side B: Want Money	👤 Person	👤 Person	List specific student groups to target.

Technical Strategy(GOAL OF THIS PROJECT in Tech side)

Everything will be inserted into the Claude, Codex, and Gemini CLI for the business discussion and execution. They will actively communicate with each other and AUTOMATE the whole entire system. Including advertising, testing, interacting with the user, etc., and tell us the result or ask us if they can execute it.
